1
During lumbar puncture procedure the needle inserted at which lumbar region?
(2 Points)
Theory
Between L4-L5
Between S3-S4
At lumbar vertebra 4
Between L1-L2
None of the above
Answer:A
2
You have the test results that show that a 73 year-old patient has prostate cancer. The
patient comes to the Clinic for a follow-up appointment. What is the best order of what
you will say to the patient for breaking bad news? Please put the options below into the correct order.
(2 Points)
Theory
1
How are you feeling and has anything changed since last time I saw you?
2
Has anyone told you the test results?
3
Would you like to know the test results?
Are you the type of person who likes to know a lot of information or a little?
5
I'm sorry I have some bad news for you
After telling a patient that they have calculated the patient starts being war and time!
After telling a patient that they have colon cancer, the patient starts being very emotional. According to E. Kübler-Ross there are 5 stages of grief. Your patient may go through these
different stages of grief as they think about the cancer diagnosis. Please put the stages of
grief in the order that a patient usually experiences them.
(2 Points)

You receive test results that show that a 42 year-old woman has breast cancer. Her father and brother came to your clinic yesterday asking you to not tell the patient if the results show it is cancer. They said that she would not cope emotionally and that they wanted to protect her. The father has a lot of "wasta" and has made a big financial donation to the hospital. So you agreed not to tell the patient. Today you remember some research about breaking bad news in Jordan and decide to do what the majority of patients wanted their doctor to do in this situation. What will you do?  (2 Points)  Theory
Tell the patient that she has breast cancer
Not tell the patient that she has breast cancer
Wait before telling the patient that she has breast cancer
Ask the relatives not to tell the patient that she has breast cancer
Ask the relatives to tell the patient that she has breast cancer
Ask the relatives to ten the patient that she has breast cancer
Answer:A 5
A 27 year-old male visits the Neurology Clinic complaining of two occasions of falling on the ground and shaking. He is otherwise well. When taking a history, you ask the neurological systems review to check for other symptoms. Which symptom will LEAST likely help you make a diagnosis?  (2 Points)  Theory
© Incontinence
Change in personality
C Tingling and numbness
Dizziness
C Loss of consciousness
Answer:B
A 55 year-old female visits your clinic feeling low in mood and having difficulty in concentrating. You ask more questions as you think she may be feeling depressed. Which response is LEAST likely to correspond with depression?  (2 Points)  Theory
I feel slow moving around
I feel worthless
I have been eating more than usual
I feel life is hopeless
I have been sleeping as usual
Answer:E

An 82 year-old female is brought to the Neurology Clinic with sudden onset weakness in
her right arm. Whilst taking a history, the lady says "I hope it is nothing serious doctor".
What is the BEST response to the patient's verbal cue?

# (2 Points)

Theory

I am sure you will get better quickly

I'm sorry, yes it is serious

Is there a reason you hope it is nothing serious?

I will do everything to help you

Thankfully this is not serious

# Answer:D

8

You are seeing a 35 year old male in clinic for a complaint of hearing loss. After performing otoscopic examination and a basic hearing screen, you also note that Weber's test lateralizes to the right. The Rinne's test shows bone conduction is longer than air conduction in the right ear. Which of the following is the most likely diagnosis?

# (2 Points)

Theory

Cerumen (wax) impaction of the left ear

Ménière's disease affecting the right ear

Ménière's disease affecting the left ear

Cerumen (wax) impaction in the right ear canal

Acoustic neuroma of the right vestibulocochlear nerve

### Answer:D

9

You are seeing a patient with a suspected psychiatric disorder in the Emergency Department. In assessing her mental state, you notice that she seems flat, as if she has lost some of the normal range of emotional responses. This is classified as an abnormal finding on which part of the mental status examination?

# (2 Points)

**Theory** 

Behavior

<sup>™</sup> Mood

Appearance

Speech

Cognition

Answer:B

When you ask your 58 year old patient how his mood has been lately, he states that he has felt depressed. Which is the most appropriate history tool to use to screen this patient for depression?

# (2 Points)

Theory

Mini-Mental Status Examination

Wechsler Adult Intelligence Scale

Mini-Cog

° PHQ-9

GAD-7

# Answer:D

1

You are assessing the mental status of a 21 year old male in Psychiatry Clinic who reports difficulty thinking clearly. He is poorly dressed and has a flat affect. He feels that others can interfere with his thoughts, and he sometimes hears voices when no one is around. What is the MOST LIKELY diagnosis from this patient's mental status examination?

# (2 Points)

Theory

Bipolar affective disorder

Obsessive-compulsive disorder

Schizophrenia

Generalized anxiety disorder

Major depressive disorder

### Answer:A

12

In Family Medicine Clinic, a patient is screened with the GAD-7. He is scored at a high value, 15. The MOST LIKELY diagnosis in this patient is:

# (2 Points)

Theory

Generalized anxiety disorder

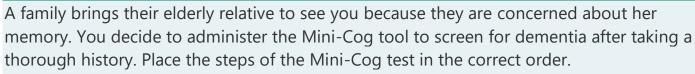

Major depressive disorder

Schizophrenia

O Dysthymia

Bipolar affective disorder

Answer:A

# (2 Points)

Theory

Choose three words from the Mini-Cog and say them to the patient

Have the patient repeat the three words to you

Have the patient draw a clock, putting all the numbers where they should go

Have the patient draw hands on the clock to show that the time is 10 past 11

Have the patient repeat the three words to you again after three minutes have passed

You are screening a patient for dementia with the Mini-Cog tool. The patient was able to repeat 2 words back to you at three minutes. He drew a clock as pictured here. What score would you give this patient on the Mini-Cog?

# (2 Points)

*Theory*

Answer:C

You are called to evaluate a psychiatric patient in the Emergency Department. Which of the following is NOT a category of the mental status examination?  (2 Points)  Theory
<ul> <li>Speech</li> <li>Thought form</li> <li>Level of consciousness</li> <li>Perceptions</li> <li>Appearance</li> </ul> Answer:C
17
In a patient with worsening coordination, all of the following are useful tests to evaluate if the cause is from his cerebellum EXCEPT: (2 Points)
Ask the patient to repeatedly pat the palm of their hand with the palm and back of their opposite hand as quickly and regularly as possible  Ask the patient to walk in a straight line  Turn the patient's head quickly to one side while looking at his eyes  With the patient lying supine, ask him to place his heel on his opposite knee, and then slide his heel up and down the shin between knee and ankle  Have the patient touch their nose and then your finger repeatedly
Answer:C
18
Which of the following is an example of evaluating for stereognosis? (2 Points)
Alternate randomly between touching the patient with one or two points of a paperclip a and asking the patient to report whether one or two points was felt
Touch the arms and legs of a patient while their eyes are closed and ask them which side has been touched
Place a familiar object such as a key in a patient's hand and ask them to identify it without looking at it
Using the blunt end of a pencil, draw a large number in the patient's palm and ask the patient to identify the number
Move the big toe of a patient up and down with their eyes closed and ask the patient to report whether you moved the toe up or down
Answer:C

Carpometacarpal joint of thumb

4

Elbow

5

Shoulder

#### 20

Put the following in the correct order of how you should perform a neurological physical exam.

# (2 Points)

1

Inspection

2

Check muscle tone

3

Check muscle power

4

Check for reflexes

5

Check for coordination

#### 21

How do you check for muscle tone in a patient?

# (2 Points)

- Squeeze the patient's muscles
- Passively move the patient's joints in all directions
- Have the patient actively move their joints in all directions against resistance
- Use a reflex hammer to illicit their deep tendon reflexes
- Have them perform rapidly alternating movements

Answer:B

22	
When examining a patient's throat, you notice the uvula is not midline, this most likely indicates a problem in which cranial nerve? (2 Points)	
III, IV, and VI V V V V V V V V V V V V V V V V V V	
VII  IX and X  XII	
Answer:D	
Allswer.D 23	
Which of the following is NOT part of the examination for cranial nerve VIII? (2 Points)	
Whisper 15 cm behind the patient	
Place a tuning fork on the patient's forehead	
Rinne test	
Quickly turn the patient's head 45 degrees to the side	
Have patient blow out their cheeks and keep them that way	
Answer:E	
Cranial nerve XI is responsible for what movements? (2 Points)	
Moving head up and down	
C Raising eyebrows	
Blinking eyes	
Sticking out tongue	
Turning head to left and right	
Answer:E	
Which of the following is NOT part of the CN II examination? (2 Points)	
Have the patient read from a vision chart 6 meters away	
Shine a light in one eye while looking for pupillary constriction in the other eye	
Have the patient look at something far away and then look at your finger 15 cm in front of them while looking for pupillary constriction	
Observing the ocular movements of the patient	
Testing the visual fields of a patient	

Answer:D

$\mathbf{l}$
In a lower motor neuron problem, which of the following would you expect? (2 Points)
Muscle wasting in the affected area
The cause of the problem located above the anterior horn cell
3+ reflex in the affected area
Positive Babinksi sign
Hypertonicity in the affected area
Answer:A 3
Lumbar puncture procedure is contraindicated in patients with? (2 Points)  Practical
Fever of unknown origin
C Papilledema
Subarachnoid Haemorrhage
Encephalitis
Infusion of anaesthetics, contrast agent
Answer:B
·
Which is the best approach to position a patient for lumbar puncture? (2 Points)  Practical
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position  None of the above  Place the patient on left side with knees are fully extended
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position  None of the above
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position  None of the above  Place the patient on left side with knees are fully extended  Answer:A
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position  None of the above  Place the patient on left side with knees are fully extended  Answer:A  5  Which of the following diagnoses is the LEAST likely to be considered as bad news by a 58 year-old female patient?  (2 Points)
(2 Points)  Practical  Place the patient on one side with knees and chin as nearly approximated as possible  Ensure that the head elevated 30 degrees  Place the patient on prone position  None of the above  Place the patient on left side with knees are fully extended  Answer:A  5  Which of the following diagnoses is the LEAST likely to be considered as bad news by a 58 year-old female patient?  (2 Points)  Practical

(2 Points)  Practical  Breast cancer  Thyroid disease  Heart failure

This patient is trying to smile and raise his eyebrows. He likely has a problem in which
cranial nerve?
(2 Points)
111, 1 4, and 41
° v
° VII
° VIII
Answer:D
Allswell.D
·
When examining the muscle power of a patient, you notice he can contract his leg muscles
but he cannot move the leg at all. How would you grade his muscle tone?
(2 Points)
C 4/5
3/3
° 2/5
° 3/5
° 1/5
Answer:E
8
A patient complains about a small part of his arm muscle that is contracting and relaxing
very quickly without him doing anything. He can see this happening but can barely feel it.
This an example of:
(2 Points)
Chorea
Chorea Fasciculations
Chorea Fasciculations
Chorea Fasciculations Myoclonus
Chorea Fasciculations Myoclonus Hypotonicity
Chorea Fasciculations Myoclonus Hypotonicity
Chorea Fasciculations Myoclonus Hypotonicity
Chorea Fasciculations Myoclonus Hypotonicity Clonus

The results from a lumbar puncture are shown below. What is the most likely diagnosis?  Protein – 60 mg/dL (normal 15-50) Glucose – 60 mg/dL (normal 45-100) WBC Count – 30 mm^3 (normal 0-5)  (2 Points)  Practical
Bacterial meningitis tuberculous meningitis Normal Fungal Meningitis
Viral Meningitis
Answer:E
A 55-year-old patient complaining of numbness and weakness on the left half of her body. With the patient lying down and her feet relaxed, you quickly dorsiflex her foot. Her foot then platarflexes several times in a repetitive manner. What is this type of movement called?  (2 Points)
Chorea Clonus Hypertonicity
<sup>C</sup> Spasticity
<sup>C</sup> Myoclonus
Answer:B
You are working at Prince Hamza Hospital and you receive the test results for a patient showing they have lymphoma. The patient's brother visits your clinic asking for you to not tell the patient the diagnosis. You want to tell the patient the diagnosis because you think that the patient has the right to know the diagnosis (if he wants to). Which ethical principle best describes what you think?  (2 Points)  Practical
Confidentiality
Beneficence
Autonomy
Consent
Non-maleficence
Answer:C

Normal tonicity Rigid hypertonicity
Character bromantanistics
Spastic hypertonicity
Mild hypotonicity  Floorid hypotonicity
Fraccia hypotomicity
Answer:B
When you check the plantar reflex of an adult patient, you notice the big toe moves downward and the other toes also flex downward. This type of reflex means the patient has: (2 Points)
No problem
A cerebellar defect
A spinal defect
A lower motor neuron lesion
An upper motor neuron lesion
Answer:A
You need to tell an 84 year-old patient some bad news. You remember that "SPIKES" is a
helpful tool for the steps to use when breaking bad news. What does the FIRST "S" mean in "SPIKES"?  (2 Points)  Practical
helpful tool for the steps to use when breaking bad news. What does the FIRST "S" mean in "SPIKES"?  (2 Points)  Practical  Silence
helpful tool for the steps to use when breaking bad news. What does the FIRST "S" mean in "SPIKES"?  (2 Points)  Practical  Silence Strategy

When your patient pushes his tongue forward outside of the mouth, it deviates to the right. This is most likely a problem with his:  (2 Points)  Practical
Right cranial nerve XI Left cranial nerve XI Left cranial nerve XII Right cranial nerve XII Left cranial nerve XII
Answer:D
Which of the following is correct while performing a lumbar puncture procedure? (2 Points)  Practical
Insert the spinal needle in the mid-line and slightly toward the head of the patient Palpate the iliac crests and then insert the needle between L2/3 space Insert the needle in the direction of the legs the patient to take a deep breath and then inserted \slowly The patients need to be standing during the procedure
Answer:A
A 19 year-old male visits the outpatient clinic complaining of headaches. On further questioning he tells you that he gets a blurring in part of his visual field for about 10 minutes before the headache starts. The headache is all over his head and bright light makes it worse. This has happened 3 times in the past 2 months. What do you think is the most likely diagnosis?  (2 Points)  Practical
Tension headache Thunderclap headache Exertional headache Cluster headache Migraine headache
Answer:E

You place your hand under a patient's jaw and ask them to open their jaw against resistance. What other tests would you perform that would examine the same cranial
nerve? (2 Points)
Have the patient smile and look for facial asymmetry
Have the patient close their eyes and try to open
Have the patient close eyes and keep them closed against resistance
Touch the patient's cornea with a piece of cotton
Draw the letter H in the air and have the patient follow your finger with their eyes
Answer:D
TAILS WCL.D
20
A 65 year old male presents to you with a complaint of dizziness. On further questioning, you believe he had vertigo and wish to perform the Dix-Hallpike positional test. Please arrange the steps of the Dix-Hallpike maneuver in the correct order.  (2 Points)  Practical
1 Explain the procedure to the patient and get his consent
Ask the patient to sit upright on the edge of the exam table
Turn the patient's head 45 degrees to one side
Rapidly lower him until the head is 30 degrees below the horizontal, asking him to keep his eyes open
5 Watch for nystagmus, then repeat the test turning the head to the other side
21
A 79 year-old male is brought to the Emergency Department complaining of not being able to see on the left-side in both eyes. He said it is like there is a vertical line from top to bottom and to the left of this he cannot see anything. What is true about this condition? (2 Points)  Practical
The cause may be a blockage to the left posterior cerebal artery
The likely diagnosis is an ipsilateral hemianopia
The likely diagnosis is a bitemporal hemianopia
The cause may be a benign tumour affecting the left visual cortex
The cause may be ischaemia to the right optic tract
Answer:E

A 78 year-old male is brought to the Emergency Department with sudden onset weakness in his left arm and numbness in his face. You ask more questions about what happened. Which of the following symptoms is he LEAST likely to have?  (2 Points)  Practical
Incontinence
Difficulty remembering words
Difficulty saying words
Facial droop
Some visual loss
Answer:A 23
Which if the following is NOT a test for evaluating the spinothalamic tract?
(2 Points)
Place a vibrating tuning fork on the top of the big toe
Touch the patient with a cold metallic object
Use a piece of cotton to touch different areas on the patient's
Use a sharp object to touch different areas on the patient's skin
Squeeze the patient's nails between your fingers very tightly
Answer:A
24
A student falls asleep during a Clinical Skills Course lecture and suddenly his body jerks and he wakes up. This type of jerking movement is called:
(2 Points)
C Tremor
O Myoclonus
Fasciculations
Athetosis
Clonus Answer:B
25
When examining the patellar reflex of a patient, you notice the reflex is slightly decreased. How would you grade this reflex? (2 Points)
O 3+
C <sub>4+</sub>
O 1+
$\circ_{2+}$
Answer:d
