

D Mycobacterium TB

D Non-TB

mycobacterium (NTM)

MYCOBACTERL INFECTIONS

Dr. Marwan Shalabi, MD

MYCOBACTERIOLOGY

- o Non-motile, nonspore – forming

MYCOBACTERIOLOGY

- o Obligate aerobes
- o Cell wall: 20 to 60 percent lipids
- o generation time of 12 to 48 hours (except rapid growers)

EPIDEMIOLOGY OF TUBERCULOSIS IN THE WORLD

- o 10 million cases per year
- o 2-3 million deaths per year
- o 600,000 cases dual TB/HIV
- o 2 billion infected individuals (blent infx)
- o \$30 \$50 billion per year direct impact

* دول العالم الثالث في كني TB

RISK FACTORS FOR

TUBERCULOSIS

Increased risk of acquiring or having infection

- Foreign born from high prevalence country
- Some healthcare workers
- o Family history of TB (2-3 generations)
- Intravenous drug or crack cocaine user
 Company of Contact with HIV interest

 - o Contact with inmates of prison or jail (past or present)
 - o Some nursing homes, residential living\\

Latent TB ran turn into an active TB infx

- if the pt becomes immuno-compramised (ex. extremes of age)

- the first 2-3 years of the latent infx

alliant infx g is عنه ماه ناه الما الماه الم

RISK FACTORS FOR **TUBERCULOSIS**

Increased risk of developing disease after infection

- o Extremes of ages: infants, elderly
- Recent (<3 years) infection
- o HIV infected
- o Immune suppression drugs or disease
- o Certain diseases: silicosis, diabetes mellitus

MITHER.

TRANSITIONS INTUBERCULOSIS

- مثلاً واحد عدو ما تعون لـ TB بياته حدايه "Susceptible كالعالمة المثلاثة واحد عدو ما تعون المثالة المثلاثة واحداثه
- مثلاً واحد ست عشما TB و کعت و عدته ح Exposed
- Infected → CaR -ve & PPD the sub coin allias (la tent)
- Diseased → Signs + symptoms give the
- Sick
- Diagnosed
- Treated
- Cured

STAGES OF TUBERCULOSIS

Exposure

- o Defined by contact investigation recent (< 3months) contact with an infectious case
- o Negative ST, physical exam and chest radiographs
- o Period during which the skin test may be negative in an infected person
- o Children < 5 years old should be treated (usually INH) because they may develop disease rapidly
- o Older children and adults often not treated, but repeat skin test 3 months after exposure over

exposure Il is your the lost, skin lest Il ais

STAGES OF TUBERCULOSIS

Infection

- o Hallmark is a "positive" skin test
- o "Germs in the body"
- o Chest radiograph is normal
- o No symptoms, physical exam is normal

SKIN-TESTING, INFECTION AND DISEASE

 Tuberculin Skin Test (TST) takes 3 weeks to 3 months to turn positive after infection has occurred

~ (latent)

Risk of disease after untreated infection:

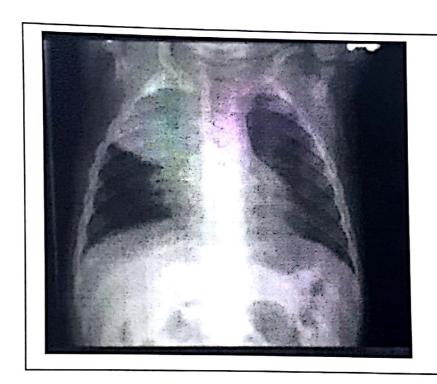

- Normal adults: 5-10 percent in lifetime (half of risk in first 2-3 years)
- o HIV-Infected adults: 5-10 percent per year
- o Infants: 40 percent in 1-2 years
- o Older children: 5-10 percent (delayed)
- * In general the likelihood of conversion of a latent TB infx to an active disease is rare

عشان حيك مطعوم اله TB (RKG) هو أول مطعوم بوخدو الطفل على عفي الشهر

STAGES OF TUBERCULOSIS

o Disease

- Clinical and/or radiographic manifestations of progressive tuberculosis infection
- o Primary: complication of initial infection
- Reactivation: disease occurs after period of dormancy of the infection
- o TST is negative in 10 % of disease cases (50 % of meningeal or miliary disease)

TIMETABLE OF PEDIATRIC **TUBERCULOSIS**

o Miliary and meningeal develop rapidly (1-12 months)

Lymph node (cervical)

2-12months

o Pleural effusion

3-9 months

o Skeletal

6months - 2 years

o Renal

1-5 years

* الـ TB ممكن يووح أي مكان (مش بس Pilmonary)

ARE CHILDREN WITH TUBERCULOSIS **EVER CONTAGIOUS?**

* عادة الكبار بعدوا الصفار مثل العكس

الأطفال مش كوس عنهم ال o The quick answer is: NO. > cough mecha 11 g sputum production

- o Orphanages caretaker with TB led to transmission; a child with TB did not
- o Schools only 2 reported "epidemics" caused by children <13 years old
- Children's Hospitals rare case reports of transmission, all with special circumstances, none has been patient -to patient

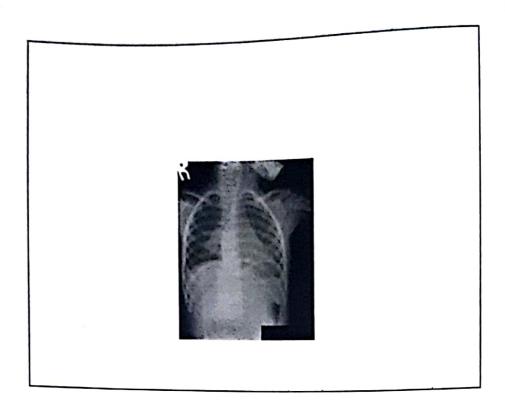

* TB disease transmission -> Air born

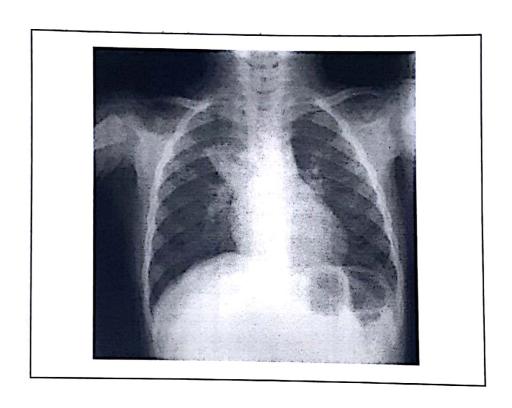

FEATURES OF CONTAGIOUS PEDIATRIC TUBERCULOSIS

- o Pulmonary:
 - o Cavitary lung lesion
 - o Sputum production
 - o Positive acid-fast stain of sputum smear
 - o Bronchoscopy
- o Draining lesions or surgical drainage of an abscess
- o This means Bone or Renal TB is not contagious as long as they not open.

CLINICAL AND RADIOGRAPHIC MANIFESTATIONS OF CHILDHOOD PULMONARY TUBERCULOSIS

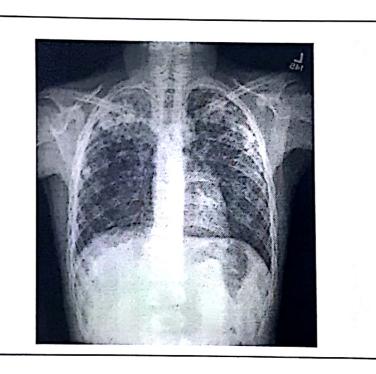

- o The CXR is way worse than how the pt. looks.
- Infants more symptomatic: fever, cough, focal wheezing, respiratory distress
- o Predominance of hilar and/or mediastinal adenopathy
- o Any lobe of lung involved; 25% multilobar
- o Local pleural reaction/effusion is common
- o Collapse-consolidation or segmental pattern most common
- o Obstructive signs/symptoms with endobronchial lesions
- o Not contagious

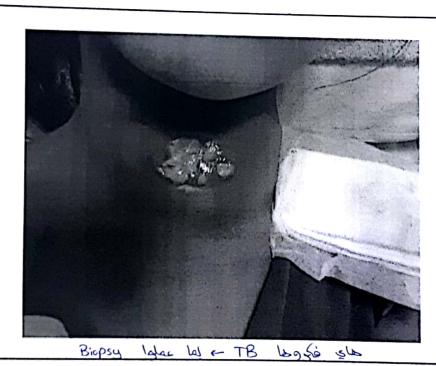

REACTIVATION TUBERCULOSIS IN PEDIATRICS

- Adolescents primarily, but can occur in younger children
- Same as adult disease: cavity or <u>upper lobe</u> infiltrates; cough, fever, weight loss, hemoptysis
- Sputum or gastric aspirates to isolate organism; bronchoscopy occasionally necessary

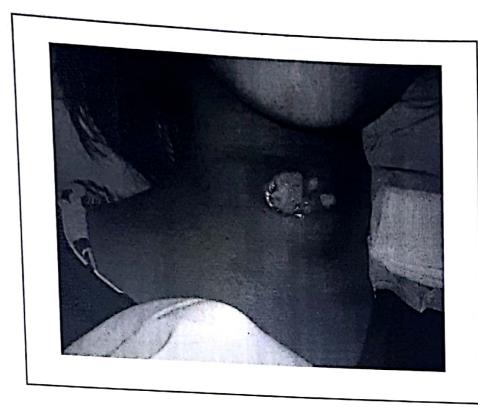

LYMPHADENITIS CAUSED BY MYCOBACTERIUM TUBERCULOSIS

- Most often unliateral; may be bilateral
- Chest x-ray usually normal
- Usually indolent onset of enlarged, fixed, matted nodes in anterior chains, submandibular
- Sub mental, occipital, axillary, supraclavicular nodes less common
- o Absence of systemic findings; minimal tenderness
- Often progress and "break down" suppuration, sinus tracts
- Major <u>differential dx</u>: Non-Tubeculosis Mycobacterium (NTM), Bartonella, malignancy

Hadakins lymphoma web

TUBERCULOUS AND NONTUBERCULOUS MYCOBACTERIAL LYMPHADENITIS

	NTM	TB
Age (years)	1-5	any
Residence	rural	suburban urban
 Risk factors for TB 	no	yes
TST on family	negative	often positive
Chest x-ray	usually neg.	positive in 10-20%
• TST (mm) 0-15	usual >10;	many >15
• Response to anti-	TB drugs: no	yes but slow

CERVICAL LYMPHADENITIS DUE TONONTUBERCULOUS MYCOBACTERIA

- o paucity of systemic signs and symptoms
- o anterior cervical chain and submandibular most common
- o also preauticular, postauticular, submental
- o firm, non-tender, fixed to underlying structures or skin
- o Usually multiple nodes: "tip of the iceberg"
- Mycobacterium Avium Complex (MAC) > M. kansasii > M. fortultum >
- o others

SURGICAL APPROACH TO MYCOBACTERIAL ADENITIS

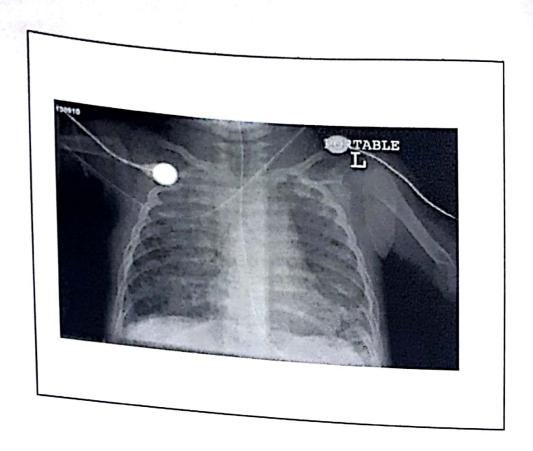

- o Fine needle aspirate can define histology, less helpful for culture (low volume of tissue)
- o Surgical excision both diagnostic and curative of NTM(if complete)
- o NEVER do an incision and drainage.
- o Antibiotics may be effective to prevent or treat recurrence clarithromycin + rifamycin + ethambutol

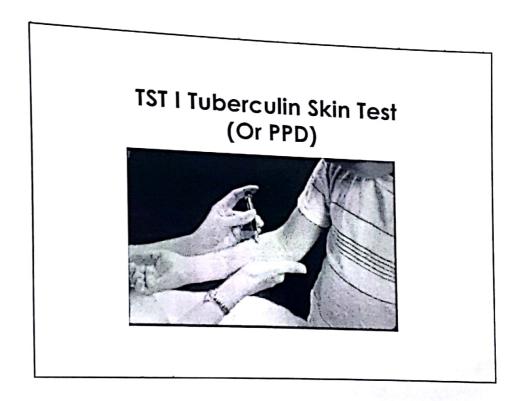

TUBERCULOUS MENINGITIS IN CHILDREN

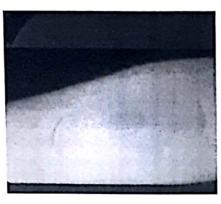

- o Most common in <u>infants, young children</u>
- o Occurs soon after Infection; source case often not yet Identified (negative family history)
- o Pathogenesis: basilar infiltrate, hydrocephalus, vasculitis,
- o infarct, tuberculoma

DISSEMINATED (MILIARY) TUBERCULOSIS IN CHILDHOOD

- o most common in <u>infants</u>, recent after infection
- o FUO common
- o usually insidious but may be explosive
- o chest radiograph usually normal early, then classic
- o other common features: hepatosplenomegaly, lymphadenopathy, cutaneous lesions, chorold tubercles
- o TST negative in up to 50% of cases
- Dx: gastric aspirate, bronchoscopy, lung blopsy, liver blopsy, bone marrow, urine culture

Dx of TB:

OGood Hx and PE

② Take a sample → ais arimal vistal is aire is

(ex. pleural effusion or LN)

3 we do an acid fast stain / acid fast culture / PCR / PPD

INDURATION SIZE - POSITIVE TUBERCULIN SKIN TEST (TST)

- o > 5 mm
 - o HIV co-infection
 - o Immune compromise
 - o Recent contact to TB
 - o Suspected disease

= PPD (Purified protein derivative)

* Intradermal injx

مشوف اله induration بعد يومين أو م

- o > 10 mm
- * o Foreign-born from a HR country (applicable to Jordan)
 - o Drug users
 - o Living in HR congregate setting
 - o Children < 4 yrs old
- o >15 mm
 - No risk factors

Does BCG VACCINES has an effect on positive TUBERCULIN SKIN TEST ?

- o The quick answer: no or very limited effect.
- o 50% of vaccinated infants do not react to a TST; most of the rest stop reacting within 5 years
- o most non-infants who get one or more BCG vaccinations will react to a TST (usually < 15 mm), but effect wapes over 5 10 years but effect wanes over 5 – 10 years
- o outside infancy, "positive" IST more likely to indicate infection with M. tuberculosis than be residual from BCG

-D The organism used in the vaccine is Mycobacterium Bovis

ice ou 11 DAY

INTERFERON TESTS (IGRA)

o Identifies Latent TB Infection (LTBI) &/or

→ o Does not cross react with BGC vaccine or most other mycobacteria

o Requires: so Jelier me IL BT (ice)

o single medical visit blood collection

o laboratory equipment and personnel

o Results in 24-48 hrs

o Alternative test for TST (PPD)

بی ما بیر بین 🗲 active) e latent 11 (نيتاب بعد علف)

ما ہتائی بال

vaccine

Comparison of Tuberculin Skin Test and Interferon- gamma Release Assays

	TST	IGRA
 Patient visits required Distinguish between TB infection and TB disease 	Two No	One No
 Specificity in adults 	70-95%	90-100%
 Sensitivity in adults 	75-90%	75-95%
 Cross-reactivity with NTM 	Yes	Less Likely
 Cross-reactivity with BCG 	Yes	Unlikely
 Antigens studied Many 	-PPD	ESAT-6, CFP-10, TB7.7

INTERFERON-GAMMA RELEASE ASSAYS (IGRA) Vs TST

- 1. No preference for one test over the other
- Should replace the TST except for immune compromised, children < 5 years
- Can be used in contact investigations (just like TST)

DIAGNOSIS OF TUBERCULOSIS IN CHILDREN

- Clinical/epidemiology : gold standard
- Acid-Fast Bacilli Stain (AFB) stains positive in < 10% of cases
- o ABF culture 3 early a.m. gastric aspirates is best:
 - o all children : sensetive 20% to 40% of cases
 - o infants : up to 75% of cases
 - o CSF, pleural fluid, other: average 25% of cases
- O PCR:
 - o compared with clinical:
 - o sensitivity is 40% to 60%
 - o specificity is 80% to 90%

EVALUATION OF A CHILD WITH SUSPECTED TUBERCULOSIS DISEASE

- o Evaluate family members, other contacts
- o Tuberculin skin test
- Appropriate radiographs
- o Sputum (if available) for AFB stain, culture
- o 3 early a.m. gastric aspirates (pulmonary)
- o Lumbar Puncture (LP) if < 1 year old
- Bronchoscopy if anatomy needs to be defined or diagnosis is in doubt
- o Report suspicion of disease to Ministry of Health.

TREATMENT OF LTBI (Latent TB Infection) IN CHILDREN

- o 9 months of <u>isoniazid</u> (daily or twice weekly under DOT) is only accepted regimen.
- o Use isoniazid unless there is documented exposure to a specific case of drugresistant TB.

TREATMENT OF TUBERCULOSIS DISEASE IN CHILDREN

- o Pulmonary (and extra pulmonary except meningitis):
 - Start with RIPE: Rifampin RIF , Isoniazid INH, Pyrazinamide PZA and Ethambutol EMB for 2 months
 - o followed by INH, RIF for another 4 months
 - o Usual length 6 months
 - o Can be once aday or twice weekly Direct Observed Therapy (DOT)
- o Meningitis:
 - Start with RIP: Rifampin RIF, Isoniazid INH, Pyrazinamide PZA PLUS aminoglycoside or ethionamide for 2 months
 - o followed by 7–10 mo of isoniazid and rifampin
 - o usual length: 9-12 months

Infection or Disease Category Latent M tuberculosis infection positive TST or IGRA result to disease,**	Regimen	Remarks
Isoniarid susceptible	9 mo of inoniazid, once a day	If daily therapy is not possible, DOT twice a week
* Isoniazid resistant * Isoniazid-rifampin resistant	4 mo of rifampin, once a day	If daily therapy is not possible, DOT twice a week can be used for 4 mo.
Pulmone and an and an and	Consult a tuberculosis specialist	
Pulmonary and extrapulmonary (except meningitis) ³	2 mo of isoniazid, rifampin, pyrazinamide, and ethambu- tol daily or noice weekly followed by 4 mo of isoniazid and rifampin' by DOT ⁴ for drug-suscepable Morkara- rum neterularii 9 to 12 mo of isoniazid and rifampin for drug-suscepable Myrokararium korii	isoniazid, rifampin, and pyrazinamide; if the risk of drug resistance is low DOT is highly desirable. If hilar adenopathy only and the risk of drug resistance is low, a 6-mo course of isoniazid and rifampin is sufficient.
Meningitis	2 mo of isoniazid, rifampin, pyrazinamide, and an aminoghytoside or ethionamide, once a day, followed by 7–10 mo of isoniazid and rifampin, once a day or twice a week [9–12 mo total) for drug-susceptible	Drugs can be given 2 or 3 times/wk under DOT. For patients who may have acquired tuberculosis in geographic areas where resistance to streptomycin is common, kanamycin, amikacin, or capreomycin can be used instead of streptomycin.

CORTICOSTEROIDS IN PEDIATRIC TUBERCULOSIS

- Useful when host inflammatory response is contributing to tissue damage or dysfunction
 - Meningitis
 - Endobronchial
 - miliary with alveolar block
 - pericardial with constriction
 - vertebral with spinal root irritation
- Can use prednisone or dexamethasone

الم there is a mass effect (swelling)

we give steroids → ، وَلَعَدُ إِلَّا يُغْفِي

BCG VACCINES

- Used in all but 2 countries: USA and Notherland
- Given in first month of life in Jordan.
- Negligible effection on TB epidemiology (Weak Vaccne)
- do not prevent infection (LTBI)
- little effect on reactivation disease
- not instruments of TB control
- Major use is preventing life-threatening forms of tuberculosis in infants and children (60% - 90%)
